

ScienceWorks Spotlight

Jane Goodall is a British primatologist and anthropologist who studied the social interactions among groups of wild chimpanzees. She first started her 60 year studies with her visit to the Gombe Stream National Park in 1960.

At age 26, Goodall brought attention to the need to protect endangered species, especially our closest animal relative the chimpanzee. She also took into account the needs of local people and how they can help protect their wildlife neighbors.
